

Vrinda Store Annual Report 2022

Data Analyst Internship – Beginner Level Project Report

1. Introduction

This project was completed as part of the **Beginner Level Data Analyst Internship task**. The objective of the project was to analyse a structured business dataset and transform the raw information into a clear and interactive spreadsheet dashboard.

The selected dataset contains sales and order-related information for **Vrinda Store during the year 2022**. The dataset includes information such as Order ID, Customer ID, Gender, Age, Date, Order Status, Sales Channel, Product Category, Quantity, Currency, Amount, City, State and other order-related details.

The main objective of this analysis was to answer important business questions such as:

- How did sales and orders change throughout the year?
- Which customer gender contributed more to sales?
- What was the overall order status distribution?
- Which states generated the highest sales?
- Which age groups contributed the most?
- Which sales channels generated the highest number of orders?
- How can the business use these findings to improve sales performance?

The final result of the project is an interactive **Vrinda Store Annual Report 2022 dashboard** created in Microsoft Excel.

2. Data Preparation and Cleaning

Before creating the dashboard, the dataset was organised and reviewed to make it suitable for analysis.

The dataset contained multiple business-related variables, including customer information, product information, sales amount, order status, sales channel and geographical location. The data preparation process focused on ensuring that the information was structured correctly and ready for spreadsheet analysis.

The following activities were considered during data preparation:

Data structure review

The dataset was reviewed to understand the purpose of each column and the type of information stored. Important fields included:

- Order ID
- Customer ID
- Gender
- Age
- Date
- Order Status
- Channel
- Product Category

- Quantity
- Amount
- City
- State

Data consistency

Columns were checked to ensure that categories such as gender, order status, sales channel, category and age group could be analysed consistently.

Date and time analysis

The order date information was used to analyse monthly trends and understand how sales changed throughout the year.

Age group preparation

Customer age information was grouped into broader business segments such as:

- Adult
- Senior
- Teenager

This made it easier to compare customer behaviour across different age categories.

Preparation for dashboard analysis

After organising the data, the dataset was used to create summary tables, pivot tables and charts. These analytical components were then combined into a single dashboard.

The data preparation stage was important because an effective dashboard depends on structured and understandable data.

3. Dashboard Design and Analysis

The final dashboard is titled “**Vrinda Store Annual Report 2022**” and presents the main business findings in a visual format.

The dashboard contains multiple charts and interactive filters. Each visual was selected to answer a specific business question.

3.1 Orders versus Sales

The first chart compares monthly sales performance with the number of orders.

The analysis shows that sales and order activity were stronger during the early months of the year. February and March appear to be among the strongest periods, followed by a general decline during later months.

This trend suggests that the business may experience stronger demand during the early part of the year.

Business significance

Understanding monthly trends helps the company identify:

- High-performing months
- Lower-performing months
- Possible seasonal demand patterns

- Periods requiring additional marketing or promotional activity

The business can investigate the reasons behind the decline in later months and develop strategies to improve sales during weaker periods.

3.2 Sales: Men versus Women

The dashboard includes a pie chart comparing sales contribution by gender.

The analysis clearly shows that **women contributed a larger share of sales than men**. Women therefore represent an important customer segment for Vrinda Store.

Business significance

Since women contribute a higher proportion of sales, the business could consider:

- Creating targeted marketing campaigns for women
- Providing personalised offers
- Promoting products that perform strongly among female customers
- Improving customer retention strategies for this segment

However, the company should also explore opportunities to increase sales among male customers.

3.3 Order Status Analysis

The order status pie chart shows the distribution of orders across categories such as:

- Delivered
- Cancelled
- Refunded
- Returned

The majority of orders were successfully **delivered**, while cancelled, refunded and returned orders represented comparatively smaller portions.

Business significance

A high proportion of delivered orders is a positive operational indicator. However, the business should continue monitoring cancellations, refunds and returns because they may indicate:

- Customer dissatisfaction
- Delivery issues
- Product quality problems
- Incorrect orders
- Problems with customer expectations

Reducing these negative outcomes can improve customer satisfaction and profitability.

4. Top Performing States

The dashboard includes a horizontal bar chart showing the **Top 5 States by Sales**.

The leading states displayed in the dashboard include:

1. Maharashtra

2. Karnataka
3. Uttar Pradesh
4. Telangana
5. Tamil Nadu

Maharashtra is shown as the highest-performing state, followed by Karnataka.

Business significance

These states represent important geographical markets for Vrinda Store. The company can use this information to:

- Increase marketing investment in high-performing states
- Improve inventory planning
- Strengthen customer retention
- Analyse which products are popular in each region

At the same time, lower-performing states may require separate promotional strategies to increase market penetration.

5. Orders: Age versus Gender

The dashboard compares customer age groups with gender.

The age groups included are:

- Adult
- Senior
- Teenager

The chart indicates that the **Adult customer group is the strongest segment**, particularly among women. Teenagers and senior customers contribute comparatively lower levels of order activity.

Business significance

The Adult segment should therefore be considered a major target audience.

Vrinda Store could focus on:

- Targeted advertisements for adult customers
- Gender-specific promotions where appropriate
- Product recommendations based on customer segments
- Loyalty programs for high-value customers

This analysis helps the business move from general marketing to more targeted customer segmentation.

6. Sales Channels Analysis

The dashboard includes a pie chart showing the contribution of different sales channels.

The major channels include:

- Amazon
- Myntra

- Flipkart
- Meesho
- Ajio
- Nalli
- Others

The dashboard shows that **Amazon is the largest sales channel**, followed by other major online platforms such as Myntra and Flipkart.

Business significance

The company should continue investing in its strongest sales channels while analysing weaker channels for improvement.

Possible business actions include:

- Increasing product visibility on high-performing channels
- Running promotional campaigns on strong platforms
- Comparing customer behaviour across channels
- Reviewing why certain channels generate fewer orders
- Optimising inventory based on channel performance

7. Interactive Filters

One of the important features of the dashboard is the use of interactive filters.

The dashboard includes filters for:

- Month
- Category
- Channel
- Ship State
- Age Group
- Gender

These filters allow the user to interact with the dashboard and analyse specific segments of the data.

For example, a business user can select:

- A specific month to view performance for that period
- A particular product category
- A specific sales channel
- A particular state
- A specific age group
- Male or female customers

The charts then update according to the selected filters.

Importance of interactive filtering

Interactive filters improve the usefulness of the dashboard because different business users can investigate the data according to their own requirements.

For example:

- A marketing manager can analyse gender and age groups.
- A regional manager can analyse state-level performance.
- A sales manager can compare channels.
- A product manager can investigate categories.

This makes the dashboard more useful than a static report.

8. Key Findings

Based on the analysis, the following important findings were identified:

1. Sales were stronger during the early months of the year

The monthly trend shows stronger sales and order activity during the first part of 2022, with lower performance later in the year.

2. Women were the largest customer segment

Female customers contributed a larger share of sales compared with male customers.

3. Adult customers were highly important

The Adult age group represented a major customer segment, particularly among women.

4. Maharashtra was the top-performing state

Maharashtra generated the highest sales among the top five states shown in the dashboard.

5. Amazon was the strongest sales channel

Among the available channels, Amazon contributed the largest share, while other online platforms also played important roles.

6. Most orders were successfully delivered

Delivered orders represented the largest portion of the order status distribution, while cancellations, refunds and returns were much smaller.

9. Business Recommendations

Based on the dashboard analysis, the following recommendations can be made to Vrinda Store:

Target adult women

Since adult women appear to be a major customer segment, marketing campaigns should be designed specifically for this group.

Focus on high-performing states

The business should continue strengthening its presence in Maharashtra, Karnataka and other top-performing states.

Optimise high-performing channels

Since Amazon and other major online channels generate a significant share of orders, Vrinda Store should focus on improving product visibility and promotions on these platforms.

Improve weaker months

The company should investigate the reasons behind lower sales during weaker months and introduce seasonal offers, discounts or marketing campaigns.

Monitor cancellations and returns

Although delivered orders dominate, the business should continuously investigate cancellations, refunds and returns to improve customer satisfaction.

Use segmentation for future campaigns

Age group, gender, location and channel information should be used to create more targeted marketing strategies.

10. Conclusion

This project demonstrates how raw business data can be transformed into useful information through spreadsheet analysis and dashboard development.

The final **Vrinda Store Annual Report 2022** dashboard provides a clear summary of sales trends, customer behaviour, order status, regional performance and sales channel performance.

The analysis shows that business decisions can be supported by identifying important patterns such as high-performing customer segments, states, months and sales channels.

The dashboard also provides interactive filtering, allowing users to explore the data from different perspectives.

Overall, this project demonstrates the complete beginner-level data analysis workflow:

Raw Data → Data Understanding → Data Cleaning and Preparation → Analysis → Charts → Dashboard → Business Insights → Recommendations

The project goes beyond creating simple charts by connecting the findings to practical business decisions. This makes the dashboard useful for understanding performance and supporting future business strategies.
